

# Unit 2 – Lesson 8: Working with a Real Dataset

## Try it:

```
print max(4, 6, 2, 6, 7, 1, 9)
```

- What does it do?

# max and min

## **max**

- Finds the largest in a set of values.

## **min**

- Finds the smallest in a set of values.

## Try it:

```
print min("cat", "dog",  
          "iguana", "anteater",  
          "hedgehog", "fish",  
          "aardvark")
```

- What does it do?

# Plotting Data

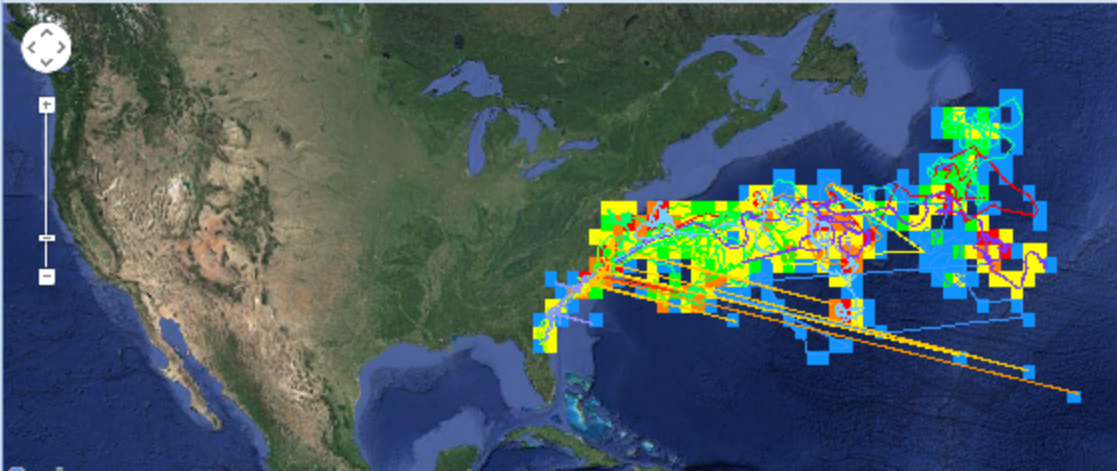

```
import simpleplot

dataset1 = [(1, 4), (1, 5), (2, 7), (4, 9)]
dataset2 = [(1, 2), (2, 7), (2, 5), (7, 6)]

simpleplot.plot_lines('Sample', 400, 300, 'x', 'y',
                     [dataset1, dataset2],
                     True, ['dataset1', 'dataset2'])
```
